ProPlay offers the best
impact protection

ProPlay

a Schmitz Foam Products product

ProPlay is the protective surface of choice for play equipment and children's playgrounds, where impact protection and cost effectiveness need to be combined.

Protects over its entire lifetime

ProPlay was perfected as a surface for play equipment during a year-long research and development process conducted by Schmitz Foam Products. The deformation and shock absorption properties of the surface remain almost unchanged over its entire lifetime, irrespective of the intensity of use.

ProPlay consists of one or several layers, depending on the required level of impact protection, and can be easily installed on any surface. When the layer is compressed (on impact), ProPlay will absorb the energy of the fall. As soon as the pressure is reduced, ProPlay resumes its original shape.

Made-to-measure protection

ProPlay can be supplied in layers with a thickness of 25, 35, 45 and 55 mm, providing increasing levels of impact protection. With ProPlay, developers of playgrounds and playing fields have the choice of a made-to-measure, maintenance-free solution.

High value

Games facilities and playground equipment must be safe for use. This is why there are legal requirements for impact protection that must be met when installing play surfaces. ProPlay easily meets all international standards and directives in the field of impact protection. Its shock-absorbing characteristics surpass those of other surfaces.

- Impact heights of over 3 metres (measured in accordance with NEN-EN1177:2008)
- Excellent drainage capacity
- Long lifetime
